## 2021-2024 Conservation and Demand Management Mid-Term Review – July 19, 2022

### Feedback Provided by:

Name: Robert Petro

Title: Energy, Infrastructure, and Environment Coordinator

Organization: Ontario Greenhouse Vegetable Growers

Email: [REDACTED]

Date: July 21, 2022

Following the July 19, 2022, engagement webinar, the Independent Electricity System Operator (IESO) is seeking feedback from stakeholders on the items discussed during the webinar. The webinar presentation and recording can be accessed from the [engagement web page](#).

**Please submit feedback to [engagement@ieso.ca](mailto:engagement@ieso.ca) by August 9, 2022.** If you wish to provide confidential feedback, please submit as a separate document, marked "Confidential". Otherwise, to promote transparency, feedback that is not marked "Confidential" will be posted on the engagement webpage.

## Competitive Mechanisms Review

Topic	Feedback
<ul style="list-style-type: none"> <li>How can the IESO further support the energy transition for consumers in all sectors</li> </ul>	<ul style="list-style-type: none"> <li>Investment in energy generating assets, such as co-generation of heat and power, and the necessary carbon sequestration for the smart use of fossil fuels to support sectors, such as greenhouse agriculture, that require CO2 as an input</li> </ul>

## General Comments/Feedback

Greenhouse agriculture represents an efficient, sustainable, and secure means of food production. High density, high efficiency agriculture requires CO2 as an input as the dense co-location of plants harvest CO2 from the atmosphere to a degree that supplementation is required. The primary climate benefit of greenhouse agriculture is the efficiency of the land use. The opportunity cost of efficient land use demonstrates that 1 acre of greenhouse land produces 5 times more tomatoes, 10 times more peppers and 20 times more cucumbers than an acre of traditional farmland. Simply put, 1 acre of greenhouse cucumbers would require 20 acres of field cucumbers. The opportunity cost dictates that the 19 acres of land saved could be used for restoring natural habitats, renewable energy projects, or other societal land use needs. As electrification grows in greenhouse agriculture to increase efficiency and decarbonize the sector, more electricity will be required. Co-generation provides heat, electricity and critically needed CO2 all generated on-site. As an input, CO2 can be generated on-site rather than trucked in from off-site which further increases the carbon impact of reduces the efficiency of greenhouse agriculture.

The future is hybrid and the wise utilization of fossil fuels to generate critically needed electricity in southwestern Ontario along with heat and CO2 in greenhouse agriculture provides a win for the climate, a win for consumers and a win for Canada.
